Foreword

Antimicrobial resistance (AMR) represents a major health and socioeconomic threat, with the potential for devastating consequences to the health of millions of people globally if concrete steps are not taken to address it. The appropriate use of antimicrobial medicines for preventive and curative measures is vital to ensure continued success with common and complex medical interventions, and to slow or reverse the progress of resistance. Since the adoption of the WHO Global Action Plan on Antimicrobial Resistance by Member States in May 2015, remarkable progress has been made by all stakeholders to ensure that AMR is getting the attention it deserves and is a priority on the health action agenda in countries. Global programmes and events, such as the World Antibiotics Awareness Week, continue to help raise public awareness and understanding to scale up action.

The misuse and overuse of antimicrobials in human medicine and food production have contributed to the increase in the prevalence of AMR. In the human health sector, a major reason given by health workers and students for the misuse of antimicrobials is the lack of understanding and adequate expertise to address AMR. A key approach to address this challenge and ensure the appropriate use of antimicrobials is to ensure that health workers acquire, through their education and training, the competencies required to prevent and combat AMR, as stated in the first objective of the WHO Global Action Plan on AMR. Although most countries have a national action plan to address AMR, the variability in quality and uneven coverage of initiatives to strengthen education and training of health workers on AMR require a standardization of educational resources for AMR that reflects global evidence and best practices but can be adapted locally. Education and training capacity and resources are currently known to differ markedly across regions and settings. This WHO competency framework for education on AMR is strategic and timely, given the widespread perception among health workers of insufficient knowledge and expertise on the topic, resulting in inappropriate antimicrobial prescription and use practices. This competency framework is intended to serve as a reference for academic institutions, educators, accreditation bodies, regulatory agencies and other users to help ensure that pre-service education and in-service training equip health workers with the requisite competencies to address AMR. It complements other relevant existing WHO guidance on AMR and lays the foundation for the development of more in-depth educational resources and AMR curricula.

James Campbell
Director
Health Workforce Department

Marc Sprenger
Director
AMR Secretariat

Acknowledgements

The development of the WHO competency framework for health workers' education and training on antimicrobial resistance was coordinated by the WHO Health Workforce Department and the AMR Secretariat with inputs from the Service Delivery and Safety and Essential Medicines and Health Products departments. The following WHO staff were responsible for coordinating the development of the document: Onyema Ajuebor, James Campbell, Giorgio Cometto (Health Workforce Department); Marcus Sprenger, Elizabeth Tayler (AMR Secretariat). WHO staff from other departments also provided contributions: Nicola Magrini, Lorenzo Moja, Ingrid Smith (Essential Medicines and Health Products Department); Sergey Eremin, Breeda Hickey, Karen Mah (AMR Secretariat); Benedetta Allegranzi, Hiroki Saito, Sara Marie Tomczyk (Service Delivery and Safety Department); Andreas Reis (Information, Evidence and Research Department); Saskia Andrea Nahrgang, Danilo Lo Fo Wong (WHO Regional Office for Europe); Klara Tisocki (WHO South-East Asia Regional Office). Administrative assistance was provided by Beatrice Wamutitu (Health Workforce Department). The following WHO interns provided review support: Yumi Ishikawa (Health Workforce Department); Johannes Koehler (Information, Evidence and Research Department); Martin Plymoth (AMR Secretariat).

WHO is grateful to the following individuals for preparing the mapping analysis of AMR educational tools and resources ahead of the WHO expert consultation meeting on health workforce and AMR education held 23–24 March 2017: Steven Hoffman, Sara Jones, Susan Rogers Van Katwyk (Global Strategy Lab, University of Ottawa).

v +

All participants at the WHO expert consultation meeting on 23–24 March 2017 are also acknowledged for their contribution to the conceptualization of the competency framework, the identification of relevant competencies, and for providing quality assurance and feedback on earlier drafts of the document: Israel Bimpe (International Pharmaceutical Students' Federation), Edith Blondel-Hill (Interior Health Authority, British Columbia), Joana Carrasqueira (International Pharmaceutical Federation), Enrique Castro-Sánchez (Imperial College London), Sabiha Essack (University of Kwazulu-Natal, South Africa), Siobhan Fitzpatrick (World Federation of Medical Education), Lindsay Grayson (University of Melbourne and Monash University), Lauri Hicks (Centers for Disease Control and Prevention, Atlanta), Steven Hoffman (Global Strategy Lab, University of Ottawa), Alison Holmes (Imperial College London), Bijie Hu (Zhongshan Hospital of Fudan University), Frances Hughes (International Council of Nurses), Benedikt Huttner (University of Geneva Hospitals), Kumud Kumar Kafle (Tribhuvan University & Alliance for the Prudent Use of Antibiotics, Nepal), Zuzana Kusynova (International Pharmaceutical Federation), Gabriel Levy-Hara (Hospital Carlos G Durand, Argentina), Caline Mattar (Junior Doctors Network/World Medical Association), Marc Mendelson (University of Cape Town, South Africa), Dilip Nathwani (University of Dundee & British Society for Antimicrobial Chemotherapy), Leonardo Pagani (General Hospital of Bolzano, Italy & European Society of Clinical Microbiology and Infectious Disease), Barbara Potter (Public Health Agency of Canada), Céline Pulcini (Université de Lorraine, France), Susan Rogers Van Katwyk (Global Strategy Lab, University of Ottawa), Susie Sanderson (British Dental Association), Nandini Shetty (Public Health England), Neil Squires (Public Health England), Julia Tainijoki-Seyer (World Medical Association), Karin Thrusky (National Centre for Antimicrobial Stewardship, University of Melbourne, Australia), Priit Tohver (International Federation of Medical Students' Associations).

WHO is also grateful to all individuals, partners and institutions involved in the consultation reviews at the various stages of development of this tool: Bojana Beović (University Medical Centre Ljubljana), Kelly Cairns (Alfred Health, Australia), Maciej Piotr Chlebicki (Singapore General Hospital, Singapore), Aubrey Clark, Jude Nwokike, Farouk Umaru (United States Pharmacopeial Convention), Oliver Dyar (Karolinska Institutet), Linus Ndegwa (Centers for Disease Control and Prevention, Kenya), Douglas Slain (West Virginia University, United States of America), Jorgen Stassijns (Institute of Tropical Medicine, Antwerp, Belgium), Evelina Tacconelli (University Hospital of Tübingen, Germany & European Society of Clinical Microbiology and Infectious Disease), Adrian M Viens (Centre for Health Ethics and Law, University of Southampton), Agnes Wechsler-Fördös (Hospital Rudolfstiftung Vienna & Alliance for the Prudent Use of Antibiotics, Austria).

WHO is grateful to the governments of Japan and the Federal Republic of Germany for their financial contributions to this project.

Executive summary

In 2015, the World Health Organization (WHO) launched the global action plan to fight antimicrobial resistance (AMR). The first objective of the plan calls for measures to improve health workers' education and training on AMR.

This WHO competency framework for health workers' education and training on AMR provides foundational normative guidance to help countries ensure that health workers are properly equipped with the competencies they need to combat the spread of AMR. Target users of this document include pre-service and in-service health education and training institutions; accreditation and licensing bodies; and health policy- and decision-making authorities.

The framework is configured in a tabular matrix format, containing core and additional AMR competencies, which have been organized across four domain areas and four categories of health workers. The domain areas include: foundations that build awareness of antimicrobial resistance, appropriate use of antimicrobial agents, infection prevention and control (IPC), and diagnostic stewardship and surveillance. The four categories of health worker groupings identify competencies that are required for: all health workers, prescribers, non-prescribers and public health officers/health services managers. This framework provides users with a reference tool to guide the analysis, framing and adaptation of locally relevant education and training materials on AMR.

Introduction

Addressing the issue of antimicrobial resistance is critical to achieving the Sustainable Development Goals (SDGs). Antimicrobial resistance is a significant public health and environmental threat. Left unchecked, common infections and minor injuries could once again become frequent killers. The scale of the AMR threat is such that no single country is free from its health and socioeconomic impact: efforts to tackle the problem will require collaboration across national and continental boundaries. AMR occurs when microbes become resistant to medicines to which they were initially susceptible. This risk is fuelled by the reduced availability of new and effective antimicrobials to treat resistant microbes (1,2). The development of drug-resistance applies to antimicrobials for a wide variety of diseases, including, among others, HIV and tuberculosis.

Globally, major gaps still exist in knowledge and awareness of AMR, as well as in the availability of quality technical resources to address the challenge (3–6). In the case of health workers, a variety of factors can result in the misuse or overuse of antimicrobials, including: a lack of knowledge or up-to-date information, inability to identify the type of infection, yielding to patient pressure to prescribe antibiotics, and a preponderance of situations that allow for financial benefit from the supply of medicines. Inadequate hygiene, sanitation in community settings and IPC measures in health facilities also facilitate the spread of infections and increase the use of antimicrobials (7). Measures to tackle these challenges through a collaboration of various stakeholders are required to avert the increasing occurrence of resistance, particularly in resource-constrained settings (8). To address this challenge, the first objective of the WHO Global Action Plan on Antimicrobial Resistance (AMR GAP) calls for raising awareness and educating and training health workers to improve antimicrobial prescribing and dispensing behaviours (9). On a similar policy level, the Global Strategy on Human Resources for Health: Workforce 2030 (10) complements the AMR GAP by offering policy guidance options on broader policies and approaches to optimize health worker education and training. WHO's role in collating and making available AMR education and training resources is crucial to support educators, decision-makers and health policy planners in implementing effective policies to guide actions on AMR control (11).

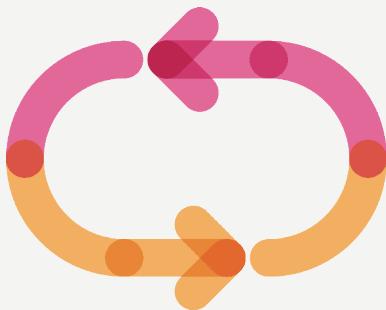

Objectives and application of the AMR competency framework

The main purpose of this document is to strengthen efforts at the country level to address AMR by outlining a set of core and additional competencies to guide the education and training of health workers.

The competency framework serves as a reference tool to be applied according to local priorities and needs. Given the comprehensive nature and interprofessional structure of the competency framework, certain competencies outlined in this document may not apply to some settings or work environments, depending on factors such as the availability of health workers with an advanced training or technological capacity. For users in such settings, the framework provides for a selective approach to implementation whilst allowing for scale up of health worker competencies whenever additional needs are identified and resources made available. The AMR competency framework is not a scope of practice for specific occupational groups and should not be interpreted as such; rather, the competencies that it identifies should be interpreted and applied in the context of the defined roles and responsibilities in a specific jurisdiction, according to local regulations and practices.

The competency framework is aimed primarily at pre-service and in-service health education and training institutions, accreditation and regulatory bodies and health policy- and decision-making authorities. It is structured to benefit all health workers, including both prescribers and non-prescribers of antimicrobials. It also includes public health and health services managers who lead institutions or have roles that influence decision- and policy-making to deliver AMR-related education and training, or have broader responsibilities through health services management and public health regulations with a bearing on antimicrobial prescription and use practices. The competency framework may be used to plan for AMR skills auditing and strengthening, and optimization of antimicrobial stewardship roles or functions.

+ 2

Methods

The development of this AMR competency framework has evolved through a combination of a review of AMR competencies obtained from a mapping of education and training resources around the world (12), and a series of refinement steps conducted through consultation exercises with a WHO expert consultation group (13), other AMR research topic experts and key health professional associations.

Building on the first objective of the WHO Global Action Plan on AMR, an informal meeting was held in March 2016 between WHO and health professional associations to describe the needs and challenges health workers face in addressing AMR (14). One of the outcomes from the meeting was an agreement to map existing AMR-related educational resources in order to identify currently available resources, provide information on needs and propose ways to address the gaps. A draft version of the AMR-education mapping report was subsequently prepared, serving as the main background document for the WHO expert consultation meeting on AMR and health workforce education and training held in March 2017.

Key findings of the report revealed a variance across settings in the availability, comprehensiveness, quality, standards and accessibility of currently available tools to address AMR education and training. The mapping report also highlighted best practice models to build upon (15). A recommendation was then made by the group on the basis of these findings to develop a global competency framework for AMR as part of measures to help address the situation of AMR education and training.

In developing the core material, evidence and guidance was extracted from the literature related to competency frameworks on appropriate prescribing and other AMR-related competency domains (16–29). The framework is adapted for human health and is holistic in approach as it brings together the different domains in complementary technical areas such as IPC, diagnostic stewardship and surveillance, leadership, and awareness and appropriate use of antimicrobials. It also features references to recent complementary policy frameworks on the appropriate use of antibiotics such as the AWaRE categorization described in the 2017 WHO Model List of Essential Medicines/for Children (EML/EMLc) (30). The WHO AWaRE system groups antibiotics into three categories – ACCESS, WATCH and RESERVE. The ACCESS group includes antibiotics recommended as empiric, first or second choice treatment options for common infectious syndromes and are listed in the EML/EMLc with the syndromes for which they are recommended. The WATCH group includes antibiotic classes that are considered generally to have higher resistance potential and that are still recommended as first or second choice treatments but for a limited number of indications. The RESERVE group includes antibiotics that should be treated as “last resort” options, or tailored to highly specific patients and settings, and when other alternatives would be inadequate or have already failed (e.g. serious life-threatening infections due to multi-drug resistant bacteria). The aim is to enhance treatment outcomes, reduce the development of drug-resistant bacteria, and preserve the effectiveness of “last resort” antibiotics by ensuring that the right antibiotics are available and prescribed for the right infections.

Structure of the AMR competency framework

The AMR competency framework is a tabular matrix of the AMR domains, health worker categories and the competencies (the knowledge, skills and attitudes) necessary to effectively address AMR in practice settings. The framework is organized across four broad categories of health workers and four domains of AMR-related competencies. For the purpose of this framework, the competencies are broadly divided into two types – core and additional. The core competencies are the essential knowledge, skills and attitudes that a health worker in a particular category is expected to have. The additional competencies (see italic text in Table 1) are the desirable knowledge skills and attitudes that a health worker may have, depending on factors such as need, relevance to practice setting, and the availability of required resources and capacity to utilize the competency.

The framework adopts an interprofessional approach based on the principle that addressing AMR requires a shared understanding, and effective collaboration and communication among health workers. Given that a number of different health workers are involved in the sequence of events and scenarios leading to the prescription and use of antimicrobials, the categorization of health workers has been structured to reflect, in a comprehensive manner, the most significant roles impacting antimicrobial prescription and use.

+ 4 As AMR is a complex public health and environmental issue, a systems approach combined with population and patient-centred strategies (including behavioural change elements) are vital to achieve the objectives of the competency framework. Essential competencies in cross-cutting areas, such as leadership, communication, law and ethics, are also important for adequately understanding, monitoring and responding to AMR. Where relevant, these competencies are embedded within related areas of the framework. A glossary is attached to help guide understanding, implementation and application.

Statement of shared goal

Maintaining a shared commitment to address AMR and protect patients in practice settings can enhance action by health policy-makers and promote collaboration among health workers. The AMR competency framework provides foundational guidance that can be adapted to different health care and resource contexts to foster appropriate prescribing and other AMR-related competencies. The use of the competency framework in health worker education and training should be grounded in a shared commitment by all stakeholders, including health workers. Such commitments may be ingrained in practice through the use of joint vision statements, as exemplified in Box 1. Similar statements, adapted to local settings, may be used in national advocacy and communication activities to support the inclusion of relevant AMR elements in educational curricula or licensing and regulatory mechanisms to ensure greater compliance and a culture of collective responsibility.

Box 1.
Sample joint vision statement for fighting AMR

We, the health care workers, accept the responsibility to improve patient care and health outcomes by protecting against the emergence and spread of antimicrobial resistance for patients and society, now and in the future. We shall achieve this goal by acquiring and maintaining the competencies related to AMR control including through improving leadership, awareness, knowledge, skills, attitudes and behavioural change regarding the appropriate prescription, dispensing and use of antimicrobials, and implementing better infection prevention and control and diagnostic stewardship.

Foundations that build awareness of antimicrobial resistance			<ul style="list-style-type: none"> 2. According to settings and where appropriate, encourage adherence to antimicrobial formulary/ protocol restrictions. 3. Understand basic principles of behaviour change in the context of prescribing antimicrobials and model good prescribing behaviour to colleagues. 				<ul style="list-style-type: none"> 2. Establish and enforce compliance with antimicrobial formulary/ protocol restrictions at local and national levels according to country policies. 3. Together with civil society, advocate for the responsible development of new antimicrobials and ensure the correct promotion of existing ones. 	

^a This framework assumes that knowledge contents are similar for pre-service education and in-service training though emphasis shifts to improving skills and attitudes for in-service training.

^b Denotes the basic AMR competencies that all health care workers should have.

^c Includes medical doctors and dentists. Note that pharmacists, nurses and midwives and other health care workers are also included in this category in settings where they are allowed to prescribe antimicrobials by regulation. The extent to which the prescribing competencies are relevant to the different cadres may vary according to scopes of practice and local regulation.

^d Non-prescribers include health workers that are not allowed by regulation to prescribe antimicrobials. (Note that in some settings, pharmacists, nurses and midwives are allowed by regulation to prescribe antimicrobials.)

^e This category may include personnel from the prescribing and non-prescribing occupational groups who have a leadership role or authority in managing AMR control.

	Nurses	Pharmacists	Nurses	Pharmacists	Laboratory scientists/ technicians											
Appropriate use of antimicrobial agents	Relevance: High	Knowledge: 1. Understand that antimicrobials have different resistance potential (AWaRE categories). 2. Understand the specific roles of other health care workers. 3. Understand the consequences (intended and unintended) of the use of antimicrobial therapy in humans.	Relevance: High	Knowledge: 1. Diagnosis of disease including the different infectious diseases of different infectious pathology. 2. Indication for antimicrobial therapy, including assessment of the severity of the infection (sepsis syndrome recognition) to inform urgency for therapy. 3. Understand that travel, recent hospitalization or previous microbiology findings of resistant bacteria are factors that predispose to colonization/infection with a resistant pathogen. 4. Understand common drug interactions between antimicrobials and other therapeutic agents, and between antimicrobials and food. Understand their clinical significance and the strategies to avoid interactions. 5. Willingness to participate in quality improvement programmes for antimicrobial use. 6. Willingness to communicate the risk of development and transmission of AMR spread within and outside of multidisciplinary antimicrobial teams.	Relevance: High	Skills: 1. Administer and record antimicrobial medicines use including review of dose/time for accuracy. 2. Perform allergy checks. 3. Update clinical and laboratory results including renal function results, drug levels, and preliminary/final microbiology results. 4. Monitor and report adverse events of antimicrobial treatment. 5. Interact with other members of the stewardship team to promote optimal antimicrobial treatment in patients (teamwork).	Relevance: Average	Knowledge: 1. Understand where and how to search/retrieve best scientific evidence to support optimal use and therapy. 2. Understand the importance of promoting appropriate antimicrobial use according to their AWaRE categories, in order to implement specific resistance-prevention actions for these antimicrobials.	Relevance: Average	Knowledge: 1. Understand the use of the antibiotic in detecting and reporting AMR in settings where antibiotics are commonly used.	Relevance: Average	Knowledge: 1. Understand where and how to search/retrieve best scientific evidence to support optimal use and therapy. 2. Understand the importance of promoting appropriate antimicrobial use according to their AWaRE categories, in order to implement specific resistance-prevention actions for these antimicrobials.	Skills: 1. Develop a systematic approach to antimicrobial prescribing and design interventions to address gaps. 2. Assess needs and respond to antimicrobial shortages. 3. Address issues related to the availability of antimicrobials including the accelerated registration of quality, cost-effective essential antimicrobials as well as the use of good review practices (GR&VP).	Skills: 1. Provide laboratory users with guidance on the most appropriate tests and their limitations. 2. Ensure ready access to the tests and communication of results to clinicians – optimize clinical liaison. 3. Ensure timeliness in the handling of microbiology samples and communication of susceptibility results.	Skills: 1. Assess prescriptions in accordance with local policies for antimicrobial use. 2. Review antimicrobial choice, dose, interval, duration and route of administration. 3. Give advice on dosage form, preparation and administration (especially for special patient cohorts such as children). 4. Counsel individuals and populations on the safe and rational use of antimicrobials (including the selection, use, contraindications, storage, drug interactions and side effects). 5. Accurately dispense prescribed antimicrobials for major and minor infections.	Skills: 1. Advocate for a conducive environment and management structure that prioritizes antimicrobial stewardship and encourages accountability for best practices on actions to improve appropriate antimicrobial use in hospitals and community settings. 2. Ensure a regular supply of essential antimicrobials. 3. Ensure the availability of adequate human and material resources for delivering health care.

Diagnostic stewardship and surveillance	<p>Relevance: High</p> <p>Knowledge:</p> <ol style="list-style-type: none"> Understand the role of national medicine regulatory authorities in the regulation of medicines; laws and regulations, registration, manufacturing, licensing, inspection and enforcement, pharmacovigilance, post-market surveillance, quality control, clinical trials, drug information. Understand the importance of reporting suspected poor quality products, therapeutic ineffectiveness, and adverse events as they may generate signals on the compromised quality of the antimicrobial products. Understand the importance of proper record keeping and use of drug codes (according to settings) for traceability of medicines. Promote the importance of AMR surveillance for characterization of resistance trends and measuring impact and burden of AMR to guide policy-makers in developing treatment recommendations. <p>Skills:</p> <ol style="list-style-type: none"> Ability to interpret and use antimicrobial susceptibility testing results (in settings where they are commonly used) and other microbiology testing tools. For infectious diseases experts, develop indicators for the rational use of antimicrobials. Ability to interpret and use AMR surveillance data. Ability to apply practice and procedures for specimen selection and collection and the completion of clinical, demographic and other epidemiological data that must accompany each specimen, correct storage and transportation of specimens to the laboratory. <p>Attitudes:</p> <ol style="list-style-type: none"> Promote the welfare of patients' post-discharge by ensuring optimal communication of for discharge or referral services. 	<p>Relevance: High</p> <p>Knowledge:</p> <ol style="list-style-type: none"> Understand the basic principles of antibiotics and other reporting tools and their interpretation. Understand principles of surveillance of AMR and antimicrobial use and the use of surveillance data. <p>Skills:</p> <ol style="list-style-type: none"> Obtain cultures and sends the cultures to the microbiology laboratory. Monitor culture results and report results to the physician. <p>Attitudes:</p> <ol style="list-style-type: none"> Promote the welfare of patients' post-discharge by ensuring optimal communication of for discharge or referral services. 	<p>Relevance: Average</p> <p>Knowledge:</p> <ol style="list-style-type: none"> Understand the role of nursing in the identification, collection, transportation and reporting of microbiological samples and test results. Understand the measurement of antimicrobial consumption, quality and associated costs in health care settings and communities. <p>Skills:</p> <ol style="list-style-type: none"> Carry out monitoring of antimicrobial use through point prevalence surveys etc. Accurately report defective or substandard antimicrobial medicines to the appropriate authorities. <p>Attitudes:</p> <ol style="list-style-type: none"> Ensure a culture of risk awareness and ethical behaviour in the identification and reporting of AMR data. <p>Skills:</p> <ol style="list-style-type: none"> Embed a surveillance culture in theory and practice. Embrace the use of appropriate technology in AMR testing. Maintain effective communication and collaborative work with clinicians, IPC professionals, hospital epidemiologists, and other health care workers involved in stewardship activities. <p>Attitudes:</p> <ol style="list-style-type: none"> Promote the generation of relevant clinical, epidemiological and microbiological data to support AMR surveillance. 	<p>Relevance: High</p> <p>Knowledge:</p> <ol style="list-style-type: none"> Understand methods for the identification of substandard and falsified medical products. Understand the relevant techniques and data required for effective surveillance of antimicrobial use and AMR in hospital and community. Understand the use of diagnostic data in AMR surveillance. <p>Skills:</p> <ol style="list-style-type: none"> Support implementation of diagnostic stewardship. Act as first line of surveillance in the correct use and reporting of microbiological tests and diagnostic tools. Contribute to hospital-specific antimicrobial susceptibility data. <p>Attitudes:</p> <ol style="list-style-type: none"> Embed a surveillance culture in theory and practice. Embrace the use of appropriate technology in AMR testing. Maintain effective communication and collaborative work with clinicians, IPC professionals, hospital epidemiologists, and other health care workers involved in stewardship activities. <p>Skills:</p> <ol style="list-style-type: none"> Ability to monitor and report on the performance of hospital and/or community AMR and related antimicrobial stewardship programmes. Identify and report of substandard and falsified medicines. Audit the quality of antimicrobial use through basic scientific methods.

Antimicrobial resistance domains ^a	Category 1: All health workers ^b		Category 2: Prescribers ^c		Category 3: Non-prescribers ^d		Category 4: Public health officers/ health services managers ^e	
	Nurses	Pharmacists	Nurses	Pharmacists	Laboratory scientists/ technicians		Attitudes:	
Diagnostic stewardship and surveillance							1. Ensure adequate protection including a safe and conducive working environment for health care workers carrying out AMR surveillance activities.	

Glossary

Antimicrobials: An agent or substance, derived from any source (microorganisms, plants, animals, synthetic or semisynthetic) that acts against any type of microorganism such as bacteria (antibacterial), mycobacteria (antimycobacterial), fungi (antifungal), parasite (antiparasitic) and viruses (antiviral). All antibiotics are antimicrobials, but not all antimicrobials are antibiotics (31).

Antimicrobial resistance: The ability of microorganisms (such as bacteria, fungi, viruses and parasites) to multiply or persist in the presence of an increased level of an antimicrobial agent (such as antibiotics, antifungals, antivirals, antimalarials and antihelmintics) relative to the susceptible counterpart of the same species.

Antimicrobial stewardship: Refers to how the appropriate use of antimicrobials can maximize both their current efficacy and the chances of their being efficacious for future generations. It embodies an organizational or health care system-wide approach to promoting and monitoring judicious use of antimicrobials to preserve their future effectiveness.

Diagnostic stewardship: Coordinated guidance and interventions to improve appropriate use of microbiological diagnostics to guide therapeutic decisions. It should promote appropriate, timely diagnostic testing, including specimen collection, and pathogen identification and accurate, timely reporting of results to guide patient treatment (32).

Drug-resistant infections: Describes infections caused by organisms that are resistant to treatment, including those caused by bacteria that do not respond to antibiotics (33).

Competencies: A “combination of knowledge, skills, motives and personal traits”, development of which should help individuals to continually improve their performance and to work more effectively.

Curriculum: A set of learning goals articulated across different health care workers that outline the intended content and process goals at particular points in time and throughout their professional career. These goals in the context of AMR, are relevant at a personal and societal level.

Infection prevention and control: A pragmatic scientific approach designed to prevent harm caused by infections to patients and health workers.

Interprofessional collaboration: Collaborative practice happens when multiple health workers from different professional backgrounds work together with patients, families, carers and communities to deliver the highest quality of care (34).

Prescribers: All health care professionals qualified to prescribe antimicrobials. In addition to physicians of all specialties and dental practitioners, the term may refer to *inter alia* prescribing nurses, pharmacists (in some jurisdictions), clinical microbiologists, midwives, optometrists, podiatrists and other health care professionals, depending on local regulations.

Principle: Defined as “an accepted or professed rule of action or conduct or a fundamental, primary, or general truth from which others are derived,” or “a fundamental doctrine or truth.” Principles are core tenets that should be acceptable to all.

Surveillance of AMR and antimicrobial use: Collection, validation, analyses and reporting of relevant clinical, microbiological and epidemiological data on AMR in targeted pathogens from different sources (e.g. humans, animals, food, environment), and on relevant antimicrobial use in humans and animals, and then applying the results to slow down or halt the development of resistance.

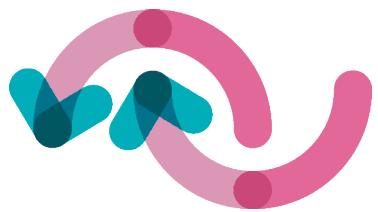

Significant and common infections: Refers to a collection of commonly and widely recognized infections occurring in the community or in a hospital setting.
