SCHISTOSOMIASIS a child health development challenge

Schistosomiasis is one of the most prevalent parasitic diseases worldwide.

The existing standard-of-care treatment is administered through mass drug administration programs mainly to school-aged children in Sub-Saharan Africa.

There is currently no treatment suitable for children six years of age and younger.

The Consortium is financially supported by Merck, with in-kind contributions from partners and grants from the Bill & Melinda Gates Foundation (2012), the Global Health Innovative Technology Fund (GHIT) (2014, 2015, 2016, 2019 & 2020), and the European & Developing Countries Clinical Trials Partnership (EDCTP) (2018 & 2021).

new

MEDICAL NEED

Schistosomiasis poses a major child health development challenge, with long-term impacts in terms of decreased

Factors that make the current standard of care generally unsuitable for preschool-aged children

Bitter taste

Absence of clinical data in very young children

The Pediatric Praziguantel Consortium has developed a potential new treatment option that is suitable for preschool-aged children.

' 10 mm

The new treatment option is a small (150 mg) tablet, that has an acceptable taste, withstands the hot and humid challenges presented by a tropical climate, and is (oro)-dispersible - making it easy to administer to very young children.
