

The malaria surveillance system assessment toolkit; a standardized approach for supporting surveillance system strengthening

May 2021

Dr Laura Anderson

Strategic Information for Response

Global Malaria Programme

Global **Malaria** Programme

**World Health
Organization**

- To provide an overview of the scope of work for the malaria surveillance assessment toolkit
- To provide a status update on development of the toolkit
- To outline next steps and timelines for the toolkit

What

A systematic approach to measuring the performance of malaria surveillance systems, and identifying and evaluating the determinants of that performance.

Where

All malaria endemic countries should carry out a surveillance system assessment.

Who

Implemented by national malaria programmes and partners interested in malaria surveillance strengthening.

When

Undertaken at any time but recommended as part of key NMP planning milestones such as a Malaria Programme Review (MPR) and National Strategic Plan (NSP) development.

Why

To provide actionable and prioritized recommendations on how to strengthen surveillance systems for malaria control and elimination

GAP:

Lack of standardization between tools and approaches used in the past - **difficult to compare over time/ between countries**

METHOD:

Existing materials were compiled and reviewed to **identify gaps** for where new tool development was required

RESULT:

The Malaria Surveillance Assessment Toolkit is single, standardized framework and set of tools which can be adapted to any context for malaria surveillance assessments aimed at the identification of key actionable gaps in malaria surveillance

The toolkits has the following characteristics:

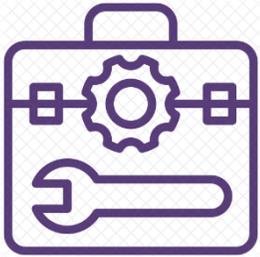

Adaptable assessment framework:

- User can define the **assessment scope**, by choosing the surveillance strategies and the indicators to be covered by the assessment.
- The **data collection tools within the Toolkit can be selected and filtered** accordingly.
- The assessment framework has been developed to assess surveillance in burden reduction and elimination settings

Standardized package of tools:

- Any malaria surveillance assessment conducted using the Toolkit will include a **minimum set of priority indicators** and **generate common and consistent expected outputs**.
- This ensures findings are comparable across countries and between assessments within a country over time

The Toolkit consists of nine tools (below) with different functions and a Reference manual and implementation guide

Function	Tools		Description
Define the scope	1	Assessment framework tool	A table of key objectives, sub-objectives, and indicators that can be used to quantify and/ or qualify strengths and weaknesses in the surveillance system. This tool should be used as the starting point in an assessment to define the scope and the approach.
	2	Concept note and protocol	A template for the outline of a short concept note for refining the scope, methods, expected outputs and outcomes of an assessment and a more detailed protocol outline required for comprehensive assessments
Collect & analyse data	3	Desk review template	A set of template tables and diagrams used to summarize what is known about malaria surveillance through document and data review, and optional interviews with surveillance programme staff and other relevant partners
	4	Data Quality Assessment tools	Tools and guidance for collecting and analysing data to specifically assess data quality at desk and service delivery levels
	5	Question Bank	A library of questions to develop survey questionnaires for data collection at service delivery levels
	6	Analysis tools To be developed 2021	Excel tools and code (in statistical software e.g., STATA) that can be adapted for data analysis for all data collected during a surveillance assessment
Develop and prioritize recommendations	7	Technical brief and Report outline and Presentation	A presentation and report template for organizing, visualizing, and interpreting results from the assessment. A technical brief is used to highlight a subset of priority results, where the complete report includes all assessment results.
	8	Assessment evaluation plan	An evaluation plan for evaluating the quality of a surveillance assessment implementation itself, which includes an indicator list, sample questionnaire, and expenditure tracker
	9	Implementation log	A log for tracking surveillance assessments that have been implemented using the toolkit

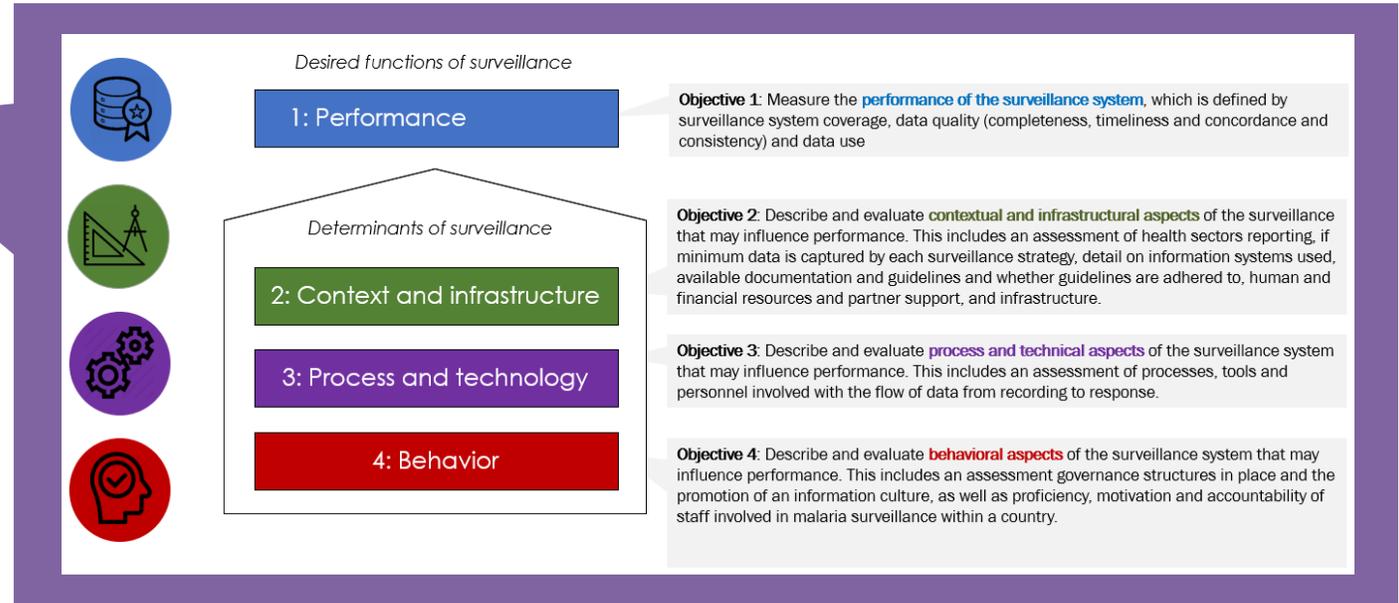

- The Toolkit builds on the [PRISM \(Performance of Routine Information System Management\)](#) model by having a framework based on four **objectives** that a surveillance assessment can address

- Under each objective is a set of defined **sub-objectives** that further detail what malaria surveillance performance is and what drives that performance

- Under each sub-objective is a set of qualitative and quantitative **indicators** that are used to assess each sub-objective and can be measured by one or more of the data collection tools within the Toolkit.
- A subset of indicators have been flagged as '**priority indicators**', representing the minimum set of metrics to be included in any malaria surveillance assessment conducted using the Toolkit. This allows the resulting standardised expected outputs to be comparable between countries and within the same country over time.

Four key objectives

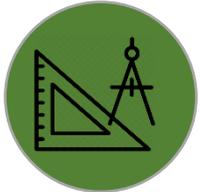

Framework:

Desired functions of surveillance

1: Performance

Objective 1: Measure the **performance of the surveillance system**, which is defined by surveillance system coverage, data quality (completeness, timeliness and concordance and consistency) and data use

Determinants of surveillance

2: Context and infrastructure

Objective 2: Describe and evaluate **contextual and infrastructural aspects** of the surveillance that may influence performance. This includes an assessment of health sectors reporting, if minimum data is captured by each surveillance strategy, detail on information systems used, available documentation and guidelines and whether guidelines are adhered to, human and financial resources and partner support, and infrastructure.

3: Process and technology

Objective 3: Describe and evaluate **process and technical aspects** of the surveillance system that may influence performance. This includes an assessment of processes, tools and personnel involved with the flow of data from recording to response.

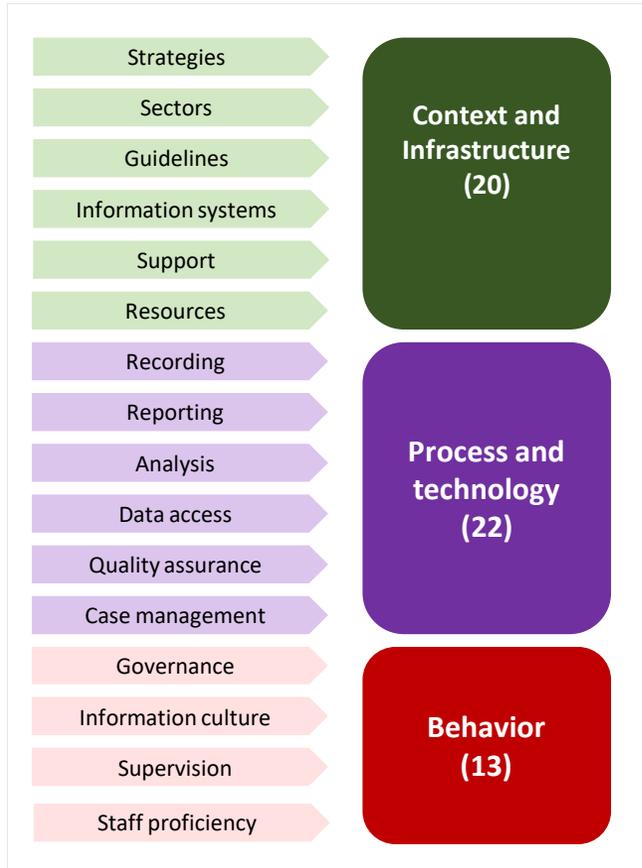

4: Behavior

Objective 4: Describe and evaluate **behavioral aspects** of the surveillance system that may influence performance. This includes an assessment governance structures in place and the promotion of an information culture, as well as proficiency, motivation and accountability of staff involved in malaria surveillance within a country.

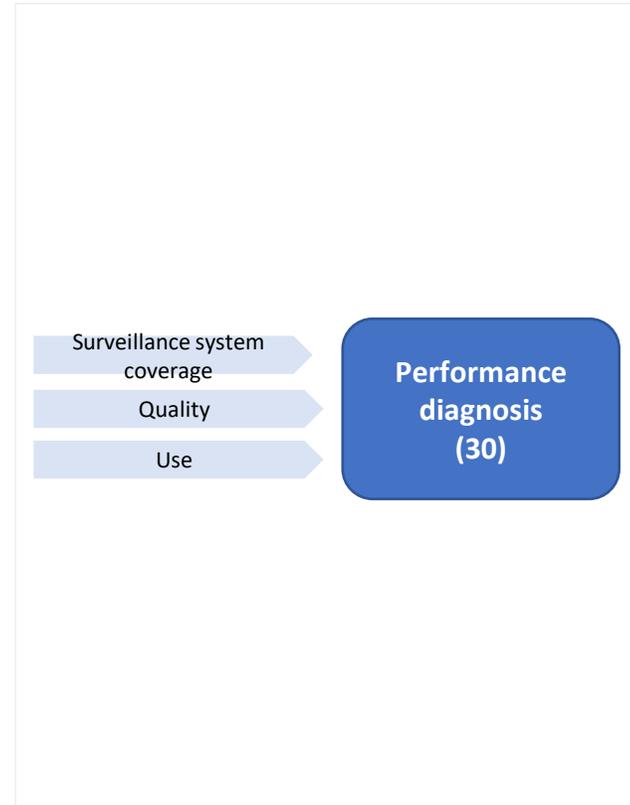

Sub-objectives and indicators (n)

Determinants/ Inputs

Performance/ Outputs

Total indicators= 85

Total priority=55

Priority burden reduction= 41

Priority elimination=50

Priority other strategies= 23

Malaria surveillance strategies

Case surveillance

Burden reduction and/or elimination settings

Intervention implementation surveillance

Chemoprevention: IPTp, IPTi, SMC, MDA

Vector control: ITNs distributed through routine channels and/or mass campaigns, IRS and larval control

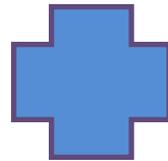

Other surveillance

Commodity tracking

Entomological surveillance

Drug resistance surveillance

Other genomic surveillance (pfhrp 2/3 gene deletions)

Assessment Framework

Select indicators based on case surveillance setting

Review and select indicators based on interest/country context or priority/optional

Priority indicators for other strategies automatically selected. The goal of an assessment of these strategies is to understand what information is collected and how, and if it is integrated and used along with case surveillance data. The toolkit does not include data quality assessments for these surveillance strategies.

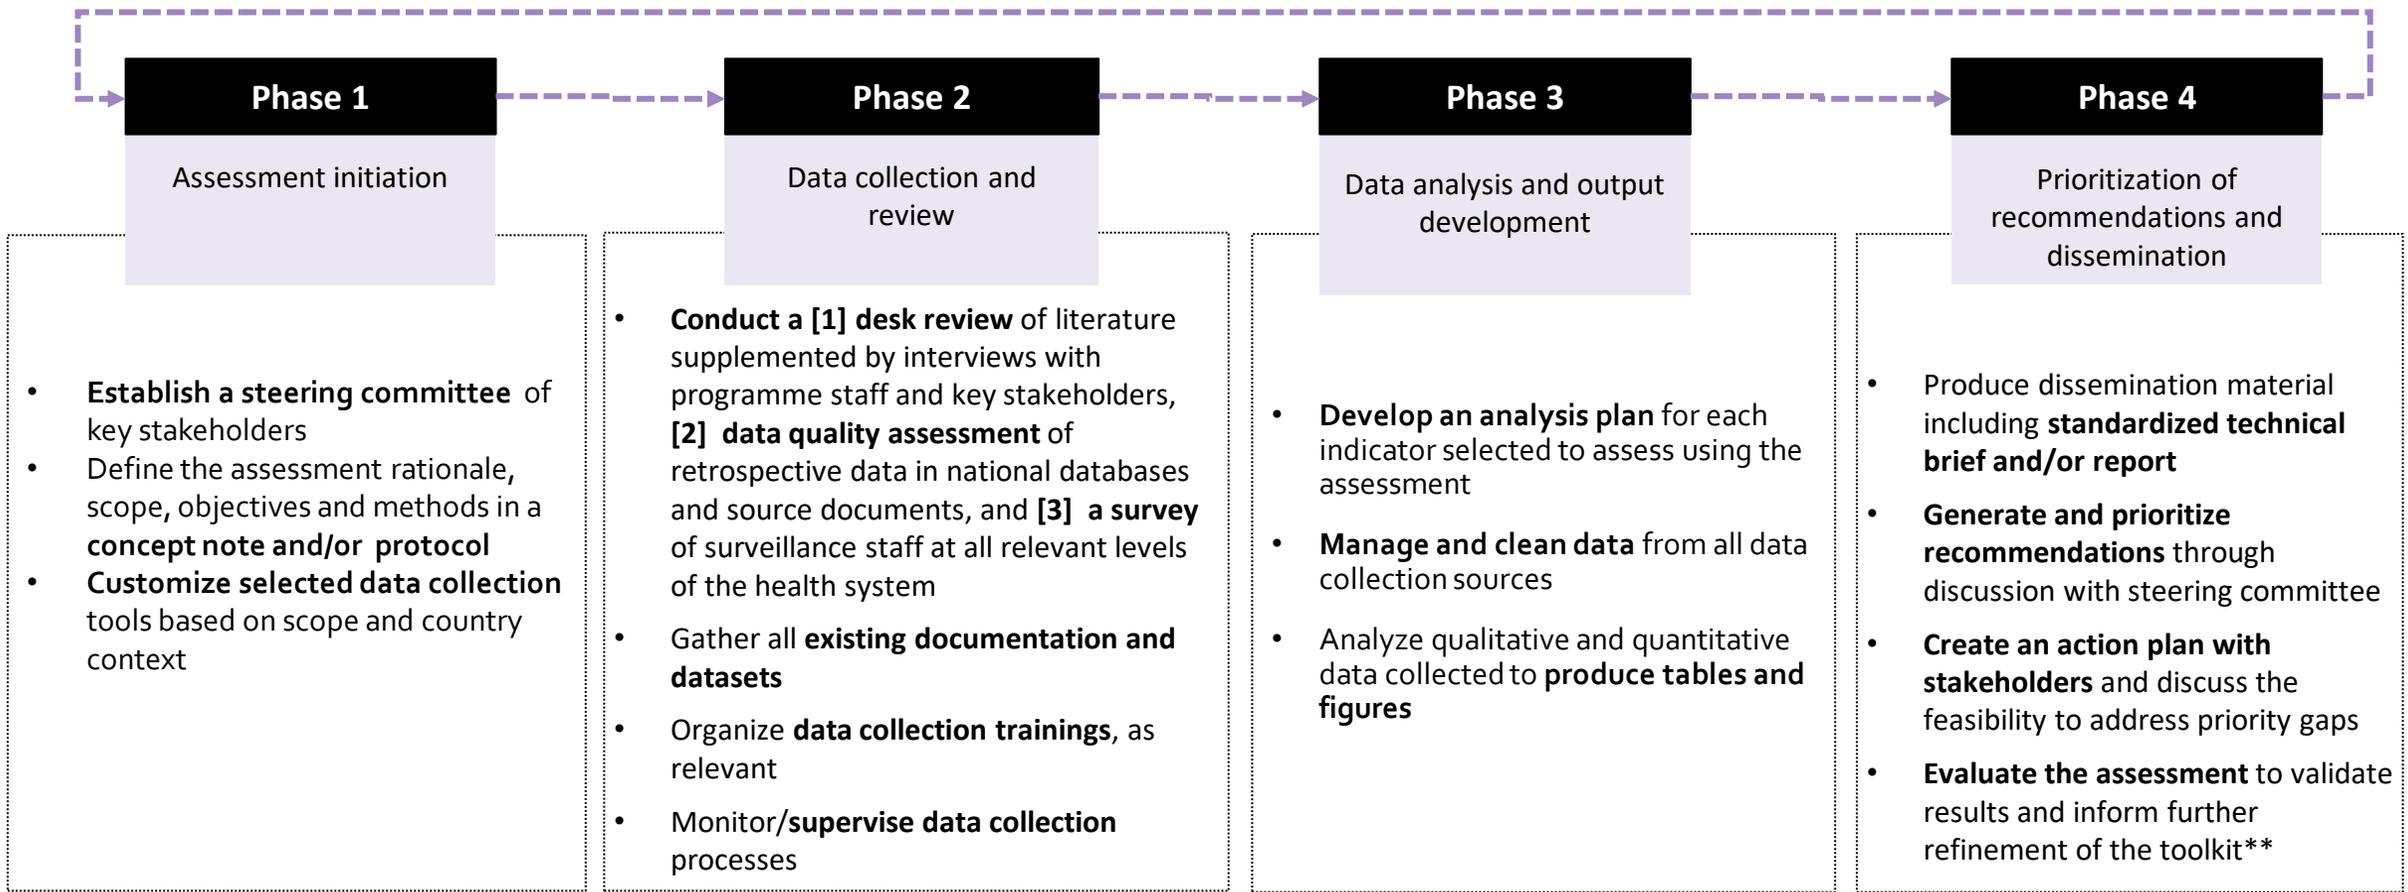

The scope will determine the assessment approach, which can be summarized in to 3 potential approaches:

	Rapid	Tailored	Comprehensive
Scope	Only <i>priority indicators</i> from all four objectives for case surveillance and all other surveillance strategies implemented in country	<i>Priority indicators</i> + user selected <i>optional indicators of interest</i> from the four objectives for case surveillance and <i>priority indicators</i> from other selected surveillance strategies	All indicators from all four objectives for case surveillance and <i>priority indicators</i> for all surveillance strategies implemented in country
Methods	Primarily limited to desk review only with few essential site visits	Desk review and surveys at different levels of the health systems (i.e., national, subnational, a sample of facilities and community healthcare workers)	Desk review and surveys at different levels of the health systems (i.e., national, subnational, a sample of facilities and community healthcare workers)
Access	Ready-to-use tool within the Toolkit that can be downloaded*	Data collection tools are customized then downloaded**	Ready-to-use data collection tools can be downloaded
Estimated resource requirement	Low; 2-4 weeks	Medium/High; up to 12 months depending on data collection methods appropriate for the selected indicators and strategies to be assessed	High: a minimum of 3 months up to 12 months depending on context
Suggested frequency	Once every 3-5 years in line with the MPR and NSP development or if necessary, once a year as part of the annual programme review	Once every 3-5 years in line with the MPR and NSP development to assess the system comprehensively	Once every 3-5 years in line with the MPR and NSP development to assess the system comprehensively

*A separate workbook with all content for rapid assessments has been made available for ease of use

** customization within the web-app will be available in 2021. The current version can be manually filtered once downloaded

*the desk review may begin in phase 1 to inform the protocol or concept note

** the expenditure tracking component of the evaluation plan should begin as soon as assessment activities start

The **Assessment Framework Tool** will indicate the most appropriate data collection method(s) required to assess each indicator. A surveillance assessment conducted using the toolkit has three methods of data collection: Desk review, Data Quality Assessment and a Survey.

User customizes tool based on surveillance strategy and indicator selection (scope)

Data collection method	Desk level	Service-delivery level
Desk Review	Compile documents and data at the national level to review and describe surveillance system(s) using the Desk Review Guide . Supplement with key informant interviews at national and subnational levels where appropriate.	
Data Quality Assessment	Extract retrospective data from national surveillance system (s) and perform a DQA using the Data Quality Assessment desk level tool	Gather data from register books and reporting forms at facilities using the Data Quality Assessment service delivery tool
Survey		Customize the Question Bank to create questionnaires for each unit/level to be surveyed.

User gets a set of standardized outputs informed by methods/tools used

User customizes tool based on surveillance strategy and indicator selection (scope)

1. Choose indicator from assessment framework tool

1.3	DATA USE		Number of indicators=7 Data use is defined in the context of this toolkit as: "instances where data are reviewed to inform programmatic action."	Desk review and survey
1.3	Priority	1.3.1	Data used for strategic, policy and operational processes Data was used to inform strategic, policy and operational processes* within the last 36 months Question format: What decision-making or strategic and policy processes have been informed by surveillance data in the previous 36 months? *strategic planning process may be: -develop or revise NSP or other health program strategy or work plan -develop subnational operational plans -stratification for targeting and prioritising of interventions -develop or revise a malaria policy -advocate for a policy or programme -monitor program performance/progress towards achieving national targets -allocation or reallocation resources from national level -distribution of commodities -subnational or national elimination certification (elimination settings) -routine review of data from proactive and reactive case detection to determine whether the approach is efficient and useful (elimination settings)	Desk review + survey

2. Indicator is selected in the Desk review guide and data is collected in a standardized Table

Table 1.3.1. Evidence of data use for strategic, policy and operational planning

Data use	Evidence found at national level	Details	Add links or screenshots as relevant
National strategic planning	✓ or ✗		
Sub-national strategic planning	✓ or ✗		
Stratification and prioritization of interventions	✓ or ✗		
Malaria policy	✓ or ✗		
Advocate for policy or programme	✓ or ✗		
Monitor program performance	✓ or ✗		
Allocation of resources	✓ or ✗		
Distribution of commodities	✓ or ✗		
Subnational or national elimination cert	✓ or ✗		
Proactive and reactive case detection	✓ or ✗		

3. A set of associated questions are selected in the question bank to be asked at different levels of the health system as part of a questionnaire

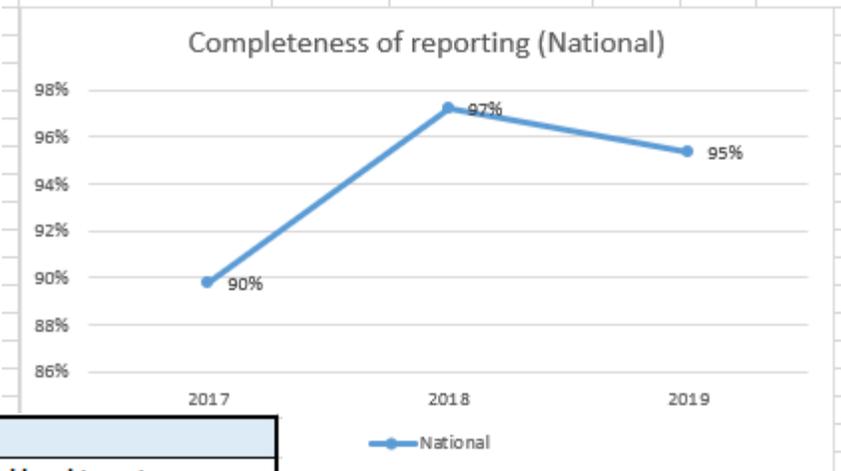

Indicator Number	Indicator	Burden reduction settings	Elimination settings	Subnational level surveillance office/unit	Service delivery level	Community level	Name	Question	Response Options
1.3.1	Data used for strategic, policy and operational processes	Burden reduction	Elimination	yes	no	no	datause_1	What strategic and operational processes have been informed by surveillance data in the previous 12 months?	a. Develop work plan b. Develop subnational operational plans c. Stratification for targeting and prioritising of intervention d. Advocate for a policy or program e. Monitor program performance/progress towards achieving national targets f. Distribute commodities g. None h. Don't know i. Other, specify:-
1.3.1	Data used for strategic, policy and operational processes	Burden reduction	Elimination	no	yes	no	datause_2	What operational processes have been informed by surveillance data in the previous 12 months?	a. Advocate for a policy or program b. Monitor program performance/progress towards achieving national targets c. Distribute commodities d. None e. Don't know f. Other, specify:-
1.3.1	Data used for strategic, policy and operational processes	-	Elimination	yes	yes	no	datause_3	Is there routine review of data from proactive and reactive case detection to determine whether the approach is efficient and useful?	a. Yes b. No c. Don't know

If survey is carried out at service delivery level, duplicate table to capture results. Table can be modified to capture results by geographical area.

Country (Name)	Completeness of reporting		
	2017	2018	2019
National	90%	97%	95%

Summary national data quality estimates		
	National level results	National level target
Completeness of reports	95%	80%
Timeliness of reporting	86%	80%
Completeness of core variables within reports	84%	80%
Consistency between core variables	82%	80%
Concordance of key variables between two reporting systems	73%	80%
Consistency over time for core indicators	Consistent trend (Yes/No)	
1. Proportion of malaria outpatients	Yes	
2. Proportion of malaria inpatients	No	
3. Proportion of malaria inpatient deaths	Yes	
4. Test positivity rate	Yes	
5. Slide positivity rate	Yes	
6. RDT positivity rate	No	
7. Proportion of suspects tested	Yes	

- To facilitate comparability between assessments over time and across geographies, a set of **results expected from all assessments** conducted using the Toolkit can be visualized in a dashboard including:
 - Data quality plots
 - A scorecard for each sub-objective (e.g. data use)
 - A scorecard for each priority indicator
- These outputs provide a high-level understanding of or first glance at the context, infrastructure, process, and technical and behavioural aspects that may be driving the surveillance system's poor or good performance.

- The **in-depth findings** from the malaria surveillance assessment can be presented in a **Technical Brief** ("2-pager) of key findings or a comprehensive **Report**, which includes a summary of the methods, a more in-depth description of the assessment results, and recommendations for surveillance strengthening actions based on key findings.

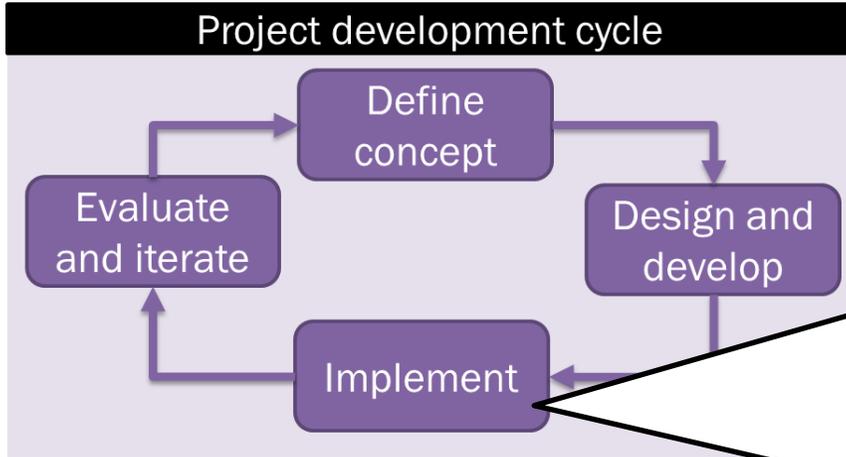

Upon completion of an assessment, recommendations should be developed based on the assessment results and prioritized in consultation with the NMP and other stakeholders based on their impact and feasibility for strengthening the surveillance system.

Recommendation	Impact		Feasibility			Funding avail.
	Public Health	Cost Saving	Timelines	Difficulties	Cost	
1 • implement surveillance staff training in Region x once every quarter to improve reporting rates	Yellow	Red	Green	Yellow	Green	Green
2 • Implement supervision for surveillance staff in Region x and y once a month to improve data use	Yellow	Green	Yellow	Red	Green	Green
3 • Shorten data collection forms to ensure completeness of forms reported by community healthcare worker	Green	Red	Yellow	Yellow	Red	Yellow

Prioritized results from assessments should be disseminated to stakeholders and used to inform action planning during key strategic planning opportunities. Examples include:

- Delegating and costing activities to roll out a new information systems or revise surveillance guidelines during NSP formulation
- Using assessment recommendations to advocate for additional funding or resources (e.g. Global Fund grants)
- Track progress in malaria surveillance outputs and outcomes over time

The toolkit is currently being implemented in 5 countries

Burkina Faso: primary data collection (survey) completed, analysis ongoing

Ghana: primary data collection (survey) to begin March 2021

DRC: primary data collection (survey) to begin Jan 2021

Cameroon: primary data collection (survey) to begin Jan 2021

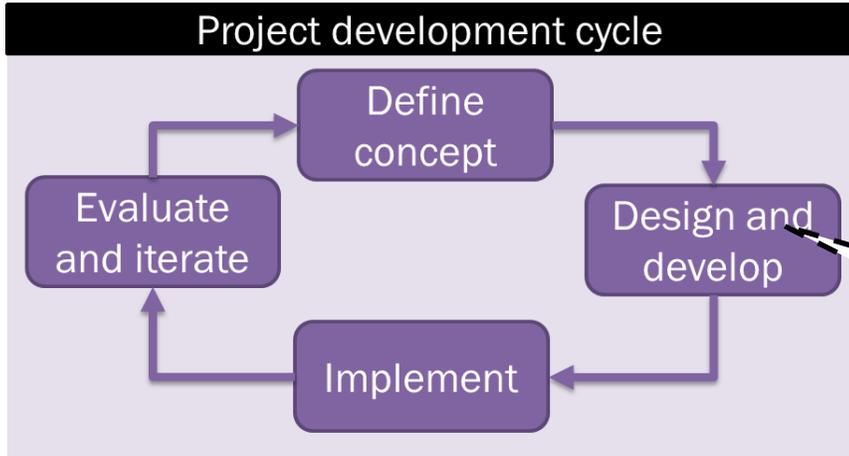

Benin: primary data collection (survey) to begin March 2021

All comprehensive assessments

Need to identify countries to carry out the rapid assessment

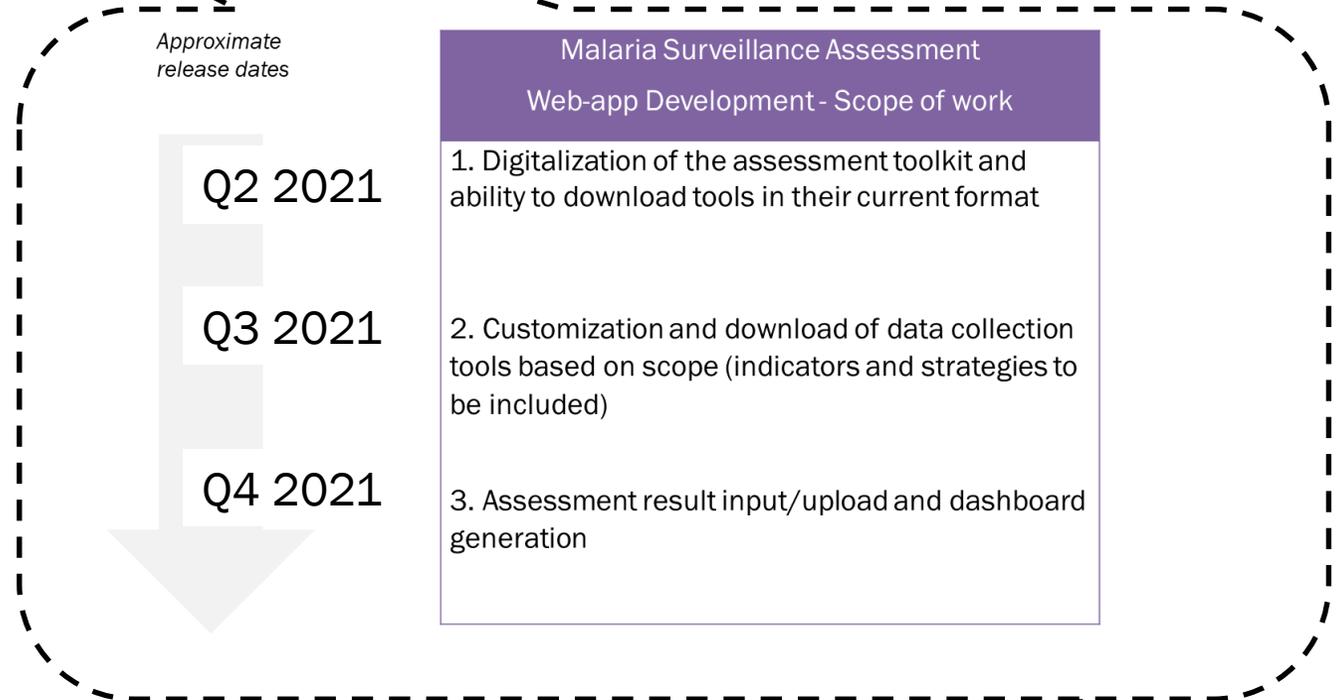

- Early feedback on toolkit suggested **poor navigation and user interface** limited usability
- Need for **standardized, comparable, and automated display** of core outputs

Features

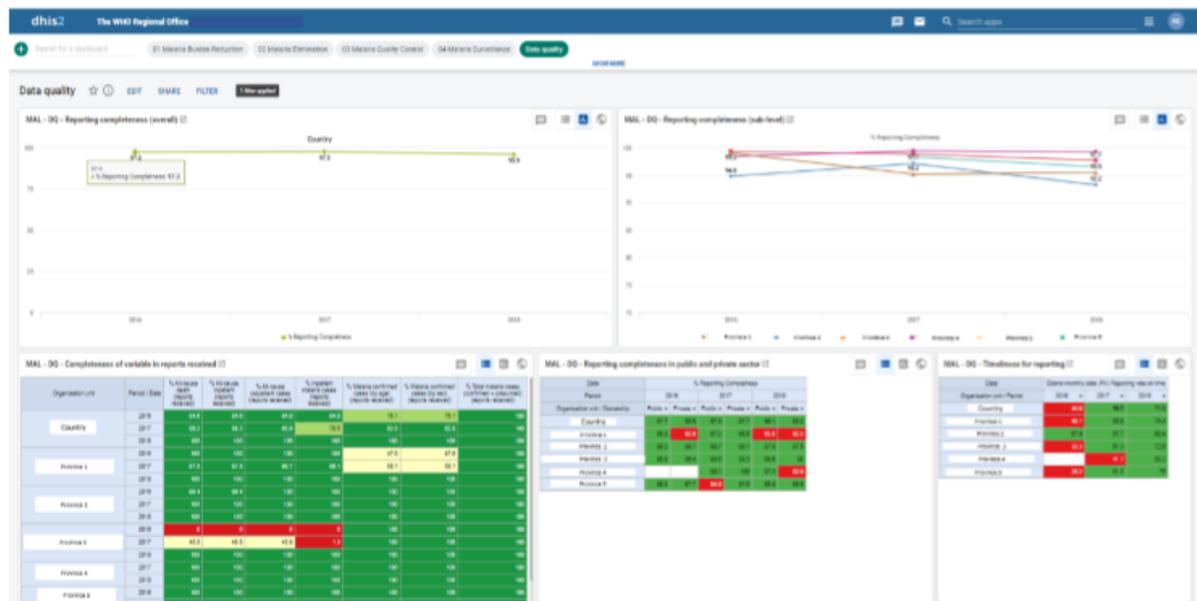

- Interface in English and French
- User permissions
- Interactive web-app with automated tool content selection and outputs
- Maps showing completed assessments
- Dashboard with summary results

Other developments

DQA findings can be visualized using standardized dashboards, that can be programmed within WHO's Malaria Module on DHIS2

Standardized visualizations for each level of the health system are provided within the WHO Malaria Module

Align WHO DQ documents and tools and update DQ app in DHIS2
